Word Cleaner Server Version Help File

Install instructions

Currently the server version only works on Windows servers and Linux (Mono).

To install Word Cleaner all you need to do is unzip the files and copy them onto a folder on your server, there is no install routine.

Server requirements

Word Cleaner should work fine on most versions of windows server. The one thing we do need installed on the server is the .NET Framework version 2 SP2. Your server should have this but if not you can download it for free from the Microsoft Website: [Download framework for Windows XP/Vista/7](#) or [Install framework on Windows 8/10](#).

On Linux you have to install Mono framework. For instance on Ubuntu to install Mono please run following commands:
sudo apt-get update
sudo apt-get install mono-complete

In Mono, only most common encodings are installed by default. Rarely used encodings are distributed in a separate package called '**mono-locale-extras.rpm**'. These include, for example, far-eastern and older Cyrillic encodings.

Limitations of the trial

- We add 'converted with word cleaner' to the top and bottom of the html file.
- We convert 75% of a file
- We convert a maximum of 10 files in a folder

These limitations are lifted once you purchase Word cleaner. When you purchase the server version we will send you a license file.

Limitations of the server version

Note MS Word does need to be installed on your server to use the Word Engine.

How does it work?

The server version uses the same template files as the desktop version; therefore what you need to do is use the desktop version of Word Cleaner to prepare your template.

We are giving one free copy of the desktop version with every server license sold.

On your desktop test the various templates or create your own to suit your needs. Please refer to the help file that comes with the desktop version of Word Cleaner for specific instructions.

Once you have your template all you need to do is copy the template file into the template folder on the server.

How to use

A command line has the following structure:

WordCleaner7Component.exe /t template /f file|folder [/anyfile] [/q] [/r] [/o folder] [/of output_file_name.html] [/h] [/ctc] [/kw] [/log] [/stdout]

Parameter List:

Parameter List (Please see Word Cleaner Settings dialog for more options):
/t "Templates\Convert to HTML.wc" – path to template (absolute or relative)
/f "Your document.docx" or **"Folder name"** – Required file name or folder to convert (works with /r option), example: \"C:\\Input\" (do not add last \\ char if you enclose folder name in quotes)
/q - Optional, Quiet mode - no output command line information
/r - Optional, Include Sub-Folders
/anyfile - Optional, if /f value is a "Folder name" all files in that folder will be converted (by default only doc, docx, odf, rft, txt, html files are converted only)
/o "Output directory"- Optional output directory - by default input file directory will be used
/of "Output file name.html" – Optional output file name - by default input file name will be used
/h - Optional, shows this help information
/ctc - Optional, copy converted html to clipboard
/kw - Optional, keep Word instance running on Word Cleaner process exit
/log - Optional, log errors to logs/server-log-file.txt, check log4net.config file in order to configure logging
/stdout - Optional, output converted file to standard output

Examples:

Example 1 - convert Example.doc with "Convert to HTML" template to the current folder:
WordCleaner7Component.exe /t "Templates\Convert to HTML.wc" /f Example.doc

Example 2 - convert all supported files from the Docs folder with the template called "Convert to HTML5" to "d:\" folder:
WordCleaner7Component.exe /r /t "Templates\Convert to HTML5.wc" /o d:\ Docs

Example 3 - convert Example.doc with template called "Convert to HTML" to "c:\" folder with "test .txt" file name:
WordCleaner7Component.exe /o c:\ /of test.txt /t "Templates\Convert to HTML.wc" /f Example.doc

Example 4 - convert Example.doc with "Convert to HTML" template to current folder, no command line messages will be shown:
WordCleaner7Component.exe /q /t "Templates\Convert to HTML.wc" /f Example.doc

Please note if you want to run WordCleaner7Component.exe from any script or app you have to have full path to WordCleaner7Component.exe as well as full paths to input/output documents that you want to convert.

Example command on x64 bit Windows would be:
"C:\Program Files (x86)\WordCleaner7Component\ WordCleaner7Component.exe" /t "Templates\Convert to HTML.wc" /f "D:\Docs\Example.doc"

Need help?

We welcome any feedback or suggestions you have about the Word Cleaner program. We will keep the program up to date with new releases, so do let us know your ideas for future versions. Unlike other software companies we actively respond to customer feedback, bugs are fixed within a few days of users informing us about them and if we like your feature suggestions then we usually implement these within a few weeks. Please send all comments to: info@wordclener.com

Thank you

We really appreciate the time you have taken to try our software, we really hope you like it.
